Report ID: 22fa87ae

Executive Security Report

Executive Summary

Total vulnerabilities: 0

Highrisk issues: 0 and no direct business impact identified from the provided context

Overall risk level: Low

Technical Details

Finding 1 SQL injection

Severity: High

AI Explanation: SQL injection is a vulnerability where an attacker can manipulate a database query by supplying malicious input. If an application builds SQL statements by directly concatenating user input, an attacker may be able to read, change, or delete data, or even take control of the database.

Fix Suggestion: Use parameterized queries or prepared statements, validate and sanitize inputs, and avoid building SQL commands with string concatenation.

Tool outcomes (Bandit, Sonar, Safety, ZAP): Failed with reasons.

No scan tools were run because the request was a general security question rather than an assessment of a specific codebase or URL.
